Agency for Environmental Protection and Technical Services

How to Design and Elaborate a Data-Base to Codify Environmental Questionnaires Data

Objectives:

Development of a data-base to collect data of environmental surveys.

The working group has to develop a data-base in order to collect basic data (sex, age, education, occupation) and answers of people to environmental questionnaires.

How to Design and Carry out Questionnaires on Environmental Protection Issues

Activities:

Phase 1: The working group receives 10 filled questionnaires regarding the “Citizen’s opinions about air pollution” developed by APAT to be used as example to collect and to codify data.

Phase 2: The filled questionnaires are utilised during the working-group to develop and to prepare a data-base in order to acquire the main options and functions needed to collect data of environmental surveys.

Particularly the working-group’s activities focus on how to collect in the data-base:

- the structural variables (sex, age, education, occupation) of the questionnaire using specific codes.
- different procedures to collect answers to closed questions, open questions and multiquestions
- note explanatory to add other information on the data-base

Phase 3: Final presentation of the data-base developed to collect data of environmental surveys
