

*Monitoring project of the aquifer system in the low Friuli plain
(Udine district)*

Aim and contents of the research project

ABSTRACT - This note describes characteristics, subjects, main stages, products and results of a research project promoted by the National Geological Survey (now APAT) and carried out in cooperation with the Dipartimento Georisorse e Territorio of the Udine University. The purpose is to define and keep under control the dynamic characteristics of groundwater resources in the low Friuli plain (Udine district) by means of monitoring networks. The paper shows the studies and the researches realized by the National Geological Survey that have been considered before starting.

KEY WORDS: hydrogeology, groundwater monitoring networks, low plain, Udine district, Friuli Venezia Giulia Region, Italy.
