How the Red List is Used

Background & History

Established in 1964, the International Union for Conservation of Nature's Red List of Threatened Species has evolved to become the world's most comprehensive information source on the global conservation status of animal, fungus and plant species.

The IUCN Red List is a critical indicator of the health of the world's biodiversity. **Far more than a list of species and their status, it is a powerful tool to inform and catalyze action for biodiversity conservation and policy change**, critical to protecting the natural resources we need to survive. It provides information about range, population size, habitat and ecology, use and/or trade, threats, and **conservation actions that will help inform necessary conservation decisions**.

How the Red List is Used

Background & History

Established in 1964, the International Union for Conservation of Nature's Red List of Threatened Species has evolved to become the world's most comprehensive information source on the global conservation status of animal, fungus and plant species.

The IUCN Red List is crucial not only for helping to identify those species needing targeted recovery efforts, but also for focusing the **conservation agenda by identifying the key sites and habitats that need to be protected. Ultimately, The IUCN Red List helps to guide and inform future conservation and funding priorities.**

Grazie per
l'attenzione

A photograph of a man with short, wavy hair and sunglasses, wearing a light gray jacket over a dark shirt. He is standing in a coastal wetland area with sand dunes, grass, and water in the background. He is holding a large bird of prey, likely an osprey, in his arms. The bird has white plumage on its head and chest, with dark brown feathers on its back and wings. A blue speech bubble originates from the man's mouth, containing the text "Grazie per l'attenzione".
